

Android Bundle Refresh After Main Pull

Comparison of the previously installed emulator build with the refreshed APK generated after pulling origin/main on 23 September 2026.

Previous source	2cab4f2 plus local uncommitted UI work
New source	16dd42c plus preserved local uncommitted UI work
Upstream delta	3 commits; 17 files; 1,409 insertions; 270 deletions
APK	58 MB arm64-v8a debug APK
Embedded bundle	1.7 MB Android JavaScript bundle; 576 modules

Notable changes

- Pulled the latest mobile AI chat workflow and course copy updates.
- Pulled backend CORS, AI tutor, playlist, compatibility, and problem-report updates.
- Preserved local Home UI refinements, tab swipe navigation, and the five-tab bottom navigation.
- Resolved the App.js overlap by retaining both the new problem-report workflow and local navigation behavior.
- Removed an upstream four-tab width constraint that clipped the preserved Profile tab on the merged build.
- The refreshed Home header visibly includes the new report-issue flag from main.

Build and verification

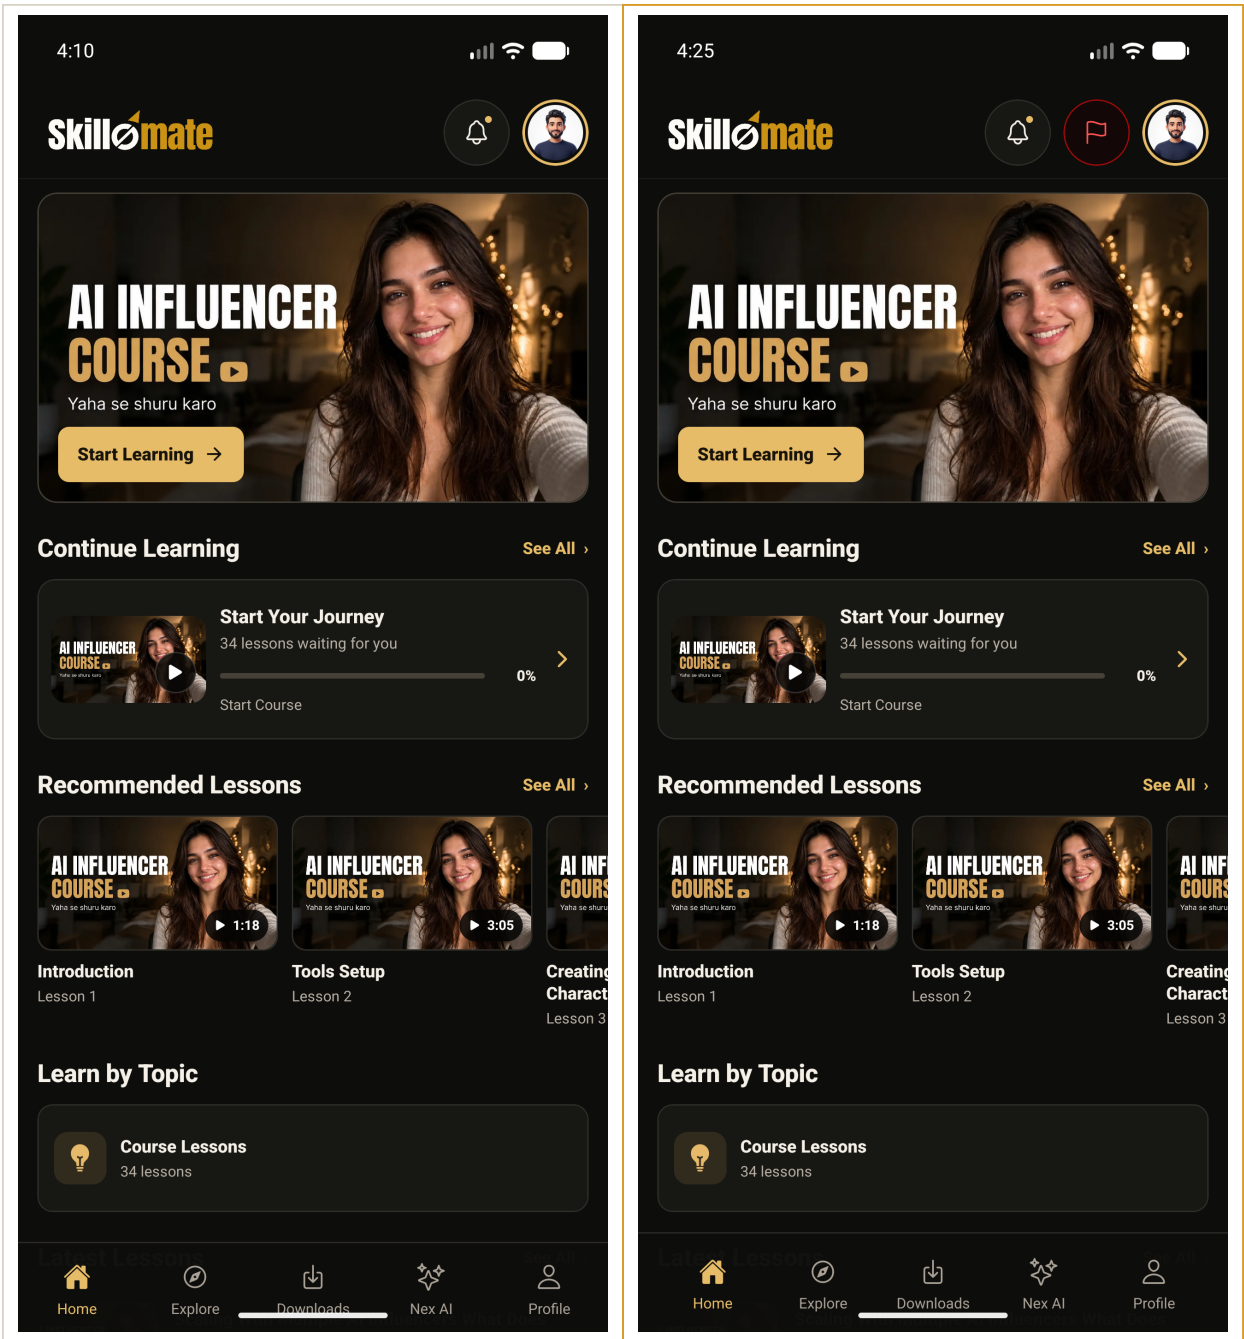

- Expo embedded bundle generation: passed.
- Android Gradle assembleDebug: passed, 204 tasks.
- APK installation with adb install -r: passed.
- App force-stop and relaunch: passed.
- Pixel emulator visual check: Home rendered without a React Native error screen; hero, learning sections, navigation, notification, profile, and report controls were visible.

Artifact integrity

APK SHA-256: 260cf2d7b72eaf28e694eceb3c5ff87dbddf90e73eb31996e8da07fcb24b876f
Bundle SHA-256: 3b146e66b53de0fbd9cca1f64157af6821a05c859684c2c496425dd6994de99f

Visual comparison

The left capture is the previously installed APK. The right capture is the refreshed bundle after the main pull. The report-issue flag in the refreshed header confirms the upstream UI is active while the local Home layout remains intact.
