

Marketing Web Clean Route Comparison

Generated on 2026-10-02 for the Skillomate marketing-web routing update.

Summary

The marketing page already deploys under `/marketing-web/`. This update makes that clean route the canonical page URL and removes `/index.html` from the browser address when a visitor lands on `/marketing-web/index.html`.

Area	Previous Version	New Version
Visible URL	A direct visit to <code>/marketing-web/index.html</code> could remain visible in the browser bar.	The page keeps <code>/marketing-web/</code> as canonical and replaces <code>/marketing-web/index.html</code> with <code>/marketing-web/</code> client-side.
SEO signal	No explicit canonical route was declared for the marketing export.	Metadata now emits <code>rel=canonical</code> with <code>href=/marketing-web/</code> .
User-facing UI	Marketing page content and layout were unchanged.	Marketing page content and layout remain unchanged; only URL handling changed.
Deployment behavior	S3 deploy test ensured <code>marketing-web/</code> is uploaded as the clean route object.	The same deploy behavior still passes, and the refreshed <code>dist/marketing-web</code> output includes the canonicalization script.

Notable Code Changes

- Imported `next/script` in `edunex-f/marketing-web/src/app/layout.tsx`.
- Added `alternates.canonical` metadata with `/marketing-web/`.
- Added a `beforeInteractive` script that runs only when `pathname` is `/marketing-web/index.html` and calls `history.replaceState` to show `/marketing-web/` while preserving query strings and hashes.

Feature And Bug-Fix Impact

This fixes the unwanted `/index.html` presentation without moving the marketing page or changing the checkout, hero, pricing, carousel, or other page content.

Build And Configuration

No hosting credentials, S3 bucket names, CloudFront distribution settings, package dependencies, or build scripts were changed. A full `edunex-f` production build regenerated the deployable `dist` folder.

Verification Performed

- `npm run build` in `edunex-f/marketing-web` completed successfully.
- `npm run build` in `edunex-f` completed successfully and refreshed `dist/marketing-web`.
- `deployment/test-frontend-s3-deploy.sh` passed, confirming the existing clean `marketing-web/` deploy object is still produced.
- Local static checks returned HTTP 200 for both `/marketing-web/` and `/marketing-web/index.html` from the refreshed `dist` folder.
- Generated HTML was inspected for `rel=canonical href=/marketing-web/`, the `canonical-marketing-route` script id, and the `/marketing-web/index.html` cleanup condition.

Remaining Note

This repository change prepares the corrected build output. Production will show the clean behavior after the refreshed `dist` is deployed and CloudFront cache is invalidated through the existing deployment workflow.
