

Introduction description cleanup

September 18, 2026

Before

The description utility removed Markdown heading markers at line starts, but imported text with inline headings such as Introduction #### What is AI could retain hashes.

After

Web and native display utilities also remove whitespace-delimited inline heading markers containing two to six hashes. Existing bold cleanup remains active. Stored course content is unchanged. Ordinary C#, hashtags, issue references and URL fragments are preserved.

Verification

Five description tests passed, including a flattened introduction matching the reported content pattern and ordinary-hash preservation. Frontend production build passed. Rendered browser testing remains unverified at the user request.

Release limitation

The production deployment version has not been verified. The screenshot also shows bold markers that the existing utility already removes. Deploy the updated frontend build for the fix to appear on the live website.
