

Marketing Payment Return Handoff Fix Comparison

Date: 2026-10-05

Summary

After successful PhonePe payment, the marketing page depended on the checkout modal being reopened so it could poll onboarding status and request a handoff code. The return URL did not reliably reopen that state, so the user could land back on the marketing page without being sent to the signup detail form. This build makes the PhonePe return URL explicitly include `index.html?payment=return#paywall` and treats `payment=return` as a status-check trigger.

Before vs New Build

Area	Previous behavior	New behavior
PhonePe return URL	Returned to the marketing page with <code>payment=return</code>	Returning to the marketing page with <code>payment=return#paywall</code> and checking state
Return handling	Only <code>#checkout/#paywall</code> opened the modal automatically	<code>payment=return</code> also opens the modal and enters checking state
Status polling	Could fail to start after returning from PhonePe, so <code>/handoff</code> was never called	Return page starts status polling, then calls <code>/api/onboarding/handoff</code>
Signup redirect	Detail filling page was skipped because no handoff code was generated	Successful confirmation redirects to <code>/signup#onboarding=<code></code>

Verification Performed

- `npm run build` completed successfully.
- `deployment/test-frontend-s3-deploy.sh` passed.
- Generated marketing bundle contains `payment=return` handling and the explicit `index.html?payment=return#paywall` return URL.
- No live PhonePe payment was executed during verification.
