

Skillomate Ad Onboarding

Local implementation and playback verification · 19 September 2026

Implemented flow

The ad page collects a phone number, verifies the real MSG91 OTP, captures the AutoPay consent inside the OTP form, and opens Razorpay immediately. The removed intermediate payment screen is no longer part of the flow. Successful payment hands the user to Skillomate signup through a short-lived one-use onboarding code.

Area	Current behavior
Course preview	Actual AI Influencer Course “Introduction” HLS stream with its course poster.
Playback	Starts after the HLS manifest is parsed; retries after the browser's early autoplay rejection.
Fallback	A visible Play button appears if autoplay is blocked or a fatal HLS error occurs.
Payments	Razorpay test-mode checkout after OTP; backend remains responsible for verification.
Recovery	Retry, status check, re-verify, and mandate-cancel controls appear only after close/failure.

Verification

JavaScript syntax and whitespace checks pass. A JSDOM smoke test confirms that a rejected initial autoplay attempt is retried on HLS MANIFEST_PARSED and that the fallback Play button is shown and hidden correctly. The local server returns the updated page and includes the selected CloudFront HLS URL and hls.js 1.7.2. Rendered browser playback remains to be confirmed manually.
