

Skillomate Core Offer Integration

Standalone ad page → main Skillomate web route · 19 September 2026

Result

The premium INR 1 offer is now a lazy-loaded React page at /offer inside the main Skillomate frontend. The CTA now opens a mobile-style bottom sheet with a dimmed backdrop, drag handle, Skillomate branding and secure phone entry. It uses same-origin backend APIs and preserves the phone OTP, Razorpay subscription, verification, recovery, cancellation and one-use signup handoff flow.

Area	Previous	New core implementation
Hosting	Separate static server on port 5174	Main web route /offer on the Skillomate origin
Frontend	Static HTML, CSS and imperative JavaScript	Lazy-loaded React page with isolated responsive CSS
API path	Static server proxied selected /api routes	Direct same-origin /api calls through existing production routing
Checkout	OTP → onboarding session → Razorpay	Same flow, including server verification and payment recovery
Signup return	Configured app origin + /signup fragment	Same-origin /signup#onboarding=<one-use code>
Video	Direct CloudFront 1920p HLS preview	Same HLS source using bundled hls.js with autoplay fallback
Deployment	Separate ad process required	Frontend build included in the production deploy and rollback script

Deployment changes

The production deployment now installs and builds edunex-f before restarting the backend, and repeats the frontend build during automatic rollback. The repository SSH helper now resolves the workspace Skillomate_Key.pem by default and supports SKILLOMATE_SSH_KEY as an override. Production requires AD_PAYMENT_MODE=test or live.

Verification

Frontend: 22 test files and 115 tests passed; production Vite build passed. Backend: 43 OTP, onboarding, Razorpay and session tests passed. Deployment shell scripts passed bash syntax validation and the workspace passed git diff whitespace validation. The running local frontend returned HTTP 200 for /offer. Rendered browser fidelity remains unverified because the in-app browser connection was unavailable.
