

Course access recovery

Skillomate web - 19 September 2026

Before

A missing or expired subscription triggered an automatic redirect from the course player. No subscription-required prompt was rendered. React page errors had no page-level boundary, allowing an uncaught render failure to remove the application UI.

After

The course page shows Subscribe to continue for no_subscription and subscription_expired responses, with subscription and course-library links. Other forbidden responses remain access errors. Checkout preserves the requested course and lesson. A page error boundary provides Reload page and Back to courses controls while preserving shared navigation.

Files

VideosPage.jsx; PaymentPage.jsx; App.jsx; PageErrorBoundary.jsx; page-recovery.css; CourseAccess.test.jsx.

Verification

Five new regression tests cover missing/expired subscriptions, unrelated forbidden responses, server errors and page crashes. Full frontend suite and production build checked. Existing large-chunk build warning remains.

Limits

The exact exception behind the reported live blank screen has not been captured. Rendered desktop/mobile testing and the affected live account remain unverified. No production deployment or payment-provider configuration changes were performed.
