

Skillomate web payroll update

Before / after report - September 19, 2026

Before

Standard Checkout and backend signature verification already existed. The checkout looked disconnected from Skillomate. Default monthly checkout selected a trial for eligible users, and a legacy gateway response could navigate away.

After

Dark/gold Skillomate Premium payroll with INR 499/month by default, three benefits, UPI call to action, recurring billing disclosure and SDK overlay branding. Annual checkout is preserved. Explicitly advertised INR 1 trials retain dedicated trial links. The legacy external redirect fallback is removed.

Payment outcomes

Native payment success requires backend-confirmed access. Failed payments stay on Skillomate with Try Again. After authorization, delayed verification offers Check payment status instead of creating another payment. Native app billing code is unchanged.

Validation

93 frontend tests and 19 backend Razorpay tests passed. Frontend production build passed. Regression coverage includes signed-result handling, redirect refusal, monthly/annual/trial selection, failures and delayed verification. Requested webhook event names are covered against provider reconciliation.

Not yet verified

Rendered desktop/mobile appearance and real UPI app return were not tested. No payment was created. Razorpay controls supported apps and subscription QR availability. Dashboard webhook event configuration was not accessed or changed; release checklist is in docs/WEB_PREMIUM_PAYWALL.md. Changes are local and not deployed.
