

Skillomate Mobile Build Comparison Report

Date: 2026-09-12

Scope: Comparison of the previous mobile dependency state and Android release artifacts against the new Expo SDK 57 compatibility-fix build.

Summary

Area	Previous	New
Expo compatibility	expo install --check reported mismatched SDK 57 packages.	Dependency check now reports: Dependencies are up to date.
Android release build	Previous signed APK existed in releases/android from 2026-09-11.	Fresh release APK built on 2026-09-12 after dependency fixes.
Android test install	Existing APK was signed.	New debug-signed test APK verifies with APK Signature Scheme v2 and v3.
iOS status	Simulator launch previously succeeded but package mismatch remained.	No new TestFlight build created in this pass; dependency source is ready for iOS rebuild.

Code And Dependency Changes

- Updated Expo core package from ^57.0.9 to ~57.0.22.
- Updated expo-video from ~57.0.3 to ~57.0.4, the highest-risk crash-related module because the app uses it in the lesson player.
- Updated expo-screen-capture from ~57.0.2 to ~57.0.3.
- Updated expo-print from ~57.0.1 to ~57.0.2.
- package-lock.json changed to lock the corrected package artifacts.

Build Outputs

- Android unsigned APK: appcopyai/releases/android/skillomate-1.0-vc1-expo57-fix-unsigned.apk
- Android debug-signed test APK: appcopyai/releases/android/skillomate-1.0-vc1-expo57-fix-debugsigned.apk
- Android Gradle output: appcopyai/android/app/build/outputs/apk/release/app-arm64-v8a-release-unsigned.apk

Verification Performed

- npx expo install --check completed with: Dependencies are up to date.
- npx expo export --platform android completed and generated the Android JS bundle.
- Gradle assembleRelease completed successfully in 3m 9s.
- The debug-signed APK verifies with apksigner using v2 and v3 signature schemes.
- An earlier iOS simulator run launched to the Skillomate login screen without an immediate startup crash.

Remaining Notes

- The debug-signed APK is for device testing only, not Play Store submission.
- For production Android or TestFlight, run the configured EAS profiles so store credentials are applied.
- The npm audit output still reports moderate vulnerabilities; do not use npm audit fix --force without review because it may introduce breaking dependency changes.
- If the app still crashes on a physical phone after installing the new build, capture Android logcat or iOS device logs immediately after the crash.
