Lesson 05 — Generate HTML Code

Learning objective

Build a single-file landing page with ChatGPT and verify its WhatsApp CTA.

Concepts and explanations

• The page uses index.html with embedded CSS, cream background, brown text, pink buttons, the three named images, and a floating WhatsApp button.

• The WhatsApp link requires an actual approved phone number.

Step-by-step lesson workflow

• Ask ChatGPT for complete index.html code.

• Put it beside the three images in sweet-crumbs.

• Open in Chrome.

• Click every WhatsApp button and confirm the correct number and message.

How to check your work

Compare the result against the original business brief and confirm that no new product claims, pricing, contact details, testimonials or guarantees were introduced.

For the Sweet Crumbs demonstration, verify the specific file names, page goal and section structure before moving to the next lesson.

If an AI response is incomplete, request the missing portion and recheck the combined result instead of assuming it is ready to publish.

Practical assignment

Create and locally test the page.

Common mistake and integrity rule

Never publish the example placeholder 91XXXXXXXXXX.

Review checklist

☐ I understand the key concepts. ☐ I completed the activity. ☐ I verified names, facts, files and links.

Based on the supplied Course Notes, Chatbot Knowledge Base and All Prompts. English explanatory notes, not a video transcript.
