Lesson 06 — Mobile Check and Changes

Learning objective

Fix broken images, inspect mobile layout and request controlled revisions.

Concepts and explanations

• A filename mismatch such as cake.jpg versus cakes.jpg can hide an image.

• Chrome DevTools supports mobile preview.

• Sample changes include real contact details, owner-supplied prices, a delivery strip and larger mobile tap targets.

Step-by-step lesson workflow

• Check image paths and refresh.

• Open Chrome DevTools phone view.

• Request targeted changes with “keep everything else the same.” Replace the code carefully, save and inspect again.

How to check your work

Compare the result against the original business brief and confirm that no new product claims, pricing, contact details, testimonials or guarantees were introduced.

For the Sweet Crumbs demonstration, verify the specific file names, page goal and section structure before moving to the next lesson.

If an AI response is incomplete, request the missing portion and recheck the combined result instead of assuming it is ready to publish.

Practical assignment

Review mobile layout and apply two changes.

Common mistake and integrity rule

Do not introduce unapproved prices or delivery promises.

Review checklist

☐ I understand the key concepts. ☐ I completed the activity. ☐ I verified names, facts, files and links.

Based on the supplied Course Notes, Chatbot Knowledge Base and All Prompts. English explanatory notes, not a video transcript.
