PhonePe Standard AutoPay

Web subscription migration - implementation and safety report | 12 October 2026

Outcome: New web subscriptions can use PhonePe Standard Checkout AutoPay for an INR 1 setup, an INR 499 first renewal after the provider-authorized waiting period, and INR 499 monthly renewals. The flow is implemented behind disabled feature flags; no live mandate or debit was created.

Previous vs new behavior

Area	Previous	New build
New web checkout	Razorpay recurring checkout	PhonePe Standard Checkout AutoPay when explicitly enabled
Introductory charge	INR 1 Razorpay trial	INR 1 PhonePe setup transaction
First renewal	INR 499 after the configured trial	INR 499 only after PhonePe's **validAfter** time; target is 24 hours
Later renewals	INR 499 monthly through Razorpay	INR 499 monthly through PhonePe notify + redeem
Existing Razorpay users	Razorpay lifecycle	Unchanged; no automatic migration
Android / iOS	Google Play / Apple IAP	Unchanged

Implemented architecture

- A dedicated Standard Checkout service builds setup, subscription-status, notification, redemption, cancellation, and authenticated webhook requests.
- A separate PhonePe AutoPay billing model tracks setup, mandate identifiers, billing cycles, notification state, redemption state, and cancellation without overwriting Razorpay state.
- Checkout grants trial access only after the INR 1 order is COMPLETED and the mandate is ACTIVE with FIXED, MONTHLY, INR 499 terms.
- The scheduler sends pre-debit notification, stores PhonePe's validAfter timestamp, and cannot redeem before it.
- Webhook and read-only status reconciliation are idempotent; a completed order cannot extend access twice.
- Account cancellation, deletion, onboarding, dashboard status, and access resolution now understand PhonePe Standard AutoPay while preserving legacy providers.

PhonePe API boundary

Operation	Standard Checkout v2 endpoint
Setup	POST /checkout/v2/pay
Mandate status	GET /checkout/v2/subscriptions/{merchantSubscriptionId}/status
Pre-debit notice	POST /checkout/v2/subscriptions/notify
Debit execution	POST /checkout/v2/subscriptions/redeem
Cancellation	POST /checkout/v2/subscriptions/{merchantSubscriptionId}/cancel

Safety controls

Control	Effect
Master flag	Disables all Standard AutoPay behavior unless PHONEPE_AUTOPAY_ENABLED=true.
Web checkout flag	Prevents new web mandates unless PHONEPE_AUTOPAY_WEB_ENABLED=true.
Scheduler flag	Prevents automated notification/redemption processing unless explicitly enabled.
Live recurring kill switch	Production INR 499 notification/redemption remains blocked unless PHONEPE_AUTOPAY_LIVE_RECURRING_ENABLED=true.
Hard amount limits	Setup accepts only 100 or 49,900 paise; recurring notification is fixed at 49,900 paise.
Mandate validation	Requires ACTIVE, FIXED, MONTHLY, maximum 49,900 paise before notify and redeem.
Uncertain-write handling	Timeouts are reconciled by status; the scheduler does not blindly retry a possibly accepted debit.

Controlled rollout

1. Deploy with all PhonePe Standard AutoPay feature flags disabled.
2. Register the production webhook URL and rotate any credential previously exposed in screenshots or chat.
3. Enable master + web flags in sandbox while scheduler and live recurring remain disabled.
4. Complete and verify one INR 1 sandbox mandate and its ACTIVE fixed monthly terms.
5. Enable the sandbox scheduler and validate notify, validAfter, redeem, webhook, and access extension.
6. Switch to live endpoints with the live recurring kill switch still disabled; validate only INR 1 setup and status.
7. Enable real INR 499 recurring processing only after explicit business approval.

Verification evidence

Check	Result
Frontend checkout/recovery tests	32 passed
Backend payment/onboarding/access/cancellation tests	96 passed
Modified backend JavaScript syntax	Passed

Check	Result
Vite application production build	Passed
Next.js marketing production build	Passed
Live PhonePe mandate or debit	Not performed

Operational rollback

- Disable PHONEPE_AUTOPAY_WEB_ENABLED to stop new PhonePe web checkouts.
- Disable PHONEPE_AUTOPAY_SCHEDULER_ENABLED and PHONEPE_AUTOPAY_LIVE_RECURRING_ENABLED to stop new notify/redeem work.
- Keep the master integration enabled while any PhonePe mandates exist so webhooks, status, and cancellation continue to work.
- Switch only new web checkout selection back to Razorpay; retain both providers for their existing subscribers.

Files and feature groups

Group	Representative changes
Backend provider	Standard AutoPay service, controller, scheduler, job, and billing model
Lifecycle integration	Payment routes, onboarding, auth reconciliation, access, cancellation, deletion
Frontend	Payment, dashboard, offer, and pricing pages now understand PhonePe redirects and recurring consent
Configuration	Disabled-by-default web, scheduler, and live recurring flags plus documented endpoints
Tests	Standard endpoint selection, fixed amounts, kill switch, timing, webhook path, provider preservation

Release state: Implementation is ready for a controlled sandbox rollout. It is not deployed and real recurring debits remain disabled.
