

Admin user reports verification

September 18, 2026

Existing flow

The learner Report issue form posts to `/api/problem-reports`. Reports are stored in MongoDB. The admin Operations > User reports page at `/admin/reports` lists reports using an admin-protected API. It supports status and category filters, pagination, reporter and device details, and private resolution notes.

Build change

Before: the static build did not explicitly generate an `/admin/reports` route shell, relying on hosting fallback routing. After: the build includes `dist/admin/reports/index.html` for direct navigation and reloads on static hosting.

Verification

Six frontend tests passed: learner submission and safe context, mobile report trigger, validation, admin display and authentication, resolution updates, and refreshing for newly submitted reports. Three backend source-contract checks passed. Production build passed and the reports route artifact exists.

Usage and limits

Open Operations > User reports. Use Refresh to load reports submitted while the page is already open. Reports can be marked New, In progress, Resolved, or Closed. Frontend tests use mocked API responses; live database submission and rendered browser testing were not performed. No production reports were created or changed.
