

Marketing Production Folder-Key Fix Comparison

Date: 2026-10-05

Summary

Production was serving the main SPA index for /static-pages/skillomate-ai-influencer-courseweb/#paywall, which produced the Skillomate Page Not Found screen. The explicit /index.html object existed and returned the marketing page, so the issue was CloudFront/S3 not resolving the nested folder path to that index object. This fix uploads the marketing HTML to the folder keys and adds a SPA fallback redirect to the explicit index.html paywall URL.

Before vs New Build

Area	Previous behavior	New behavior
Production folder URL	/static-pages/skillomate-ai-influencer-courseweb/ returned main SPA index	Deploy main SPA index and marketing HTML to static-pages/skillomate-ai-influencer-courseweb/
Explicit index URL	/static-pages/skillomate-ai-influencer-courseweb/index.html supported and used as the SPA fallback	Still supported and used as the SPA fallback
SPA fallback	If CloudFront served index.html for the static route, Redirected to marketing web page	Redirected to marketing web page
Deployment test	Smoke test checked legacy /marketing-web compatibility	Smoke test now also checks the two static folder-key put-object u

Verification Performed

- Confirmed live folder URL returned the main SPA index while the explicit /index.html URL returned the 59 KB marketing HTML object.
- npm run build completed successfully.
- deployment/test-frontend-s3-deploy.sh passed with the new static folder-key assertions.
- AWS deploy environment variables were not present in this shell, so the live deployment must be run by the existing deploy pipeline or from an environment with SKILLOMATE_FRONTEND_BUCKET and SKILLOMATE_FRONTEND_DISTRIBUTION_ID.
