

Learner Progress Data Fix

Before/after implementation report - 17 September 2026

Previous behavior	New behavior
The admin endpoint joined course progress only by the stored Mongo user ID and calculated watch metrics only from newer analytics/progress collections. Legacy records did not join, and CourseProgress.videoProgress watch time was ignored. The UI therefore showed 0%, 0 min, and 0 watched videos even when activity data existed.	The endpoint now resolves progress by exact user ID with safe, unique email and normalized-phone fallbacks. It uses videoProgress as a watch-data fallback and derives course count and average progress from analytics duration/coverage when course-summary records are unavailable.

Live verification

Check	Result	Evidence
Admin API	PASS	HTTP 200; returned 87 learners.
Activity population	PASS	15 learners now have course progress or watch activity.
Progress calculation	PASS	Maximum returned average progress is 100%.
Watch calculation	PASS	118 total watch minutes returned across learners.
Regression tests	PASS	9 maintenance tests and 3 admin user-control tests passed.
Syntax/build	PASS	Backend syntax check and frontend production build passed.

Data-integrity safeguard

Fallback matching is used only when an email or normalized phone number uniquely identifies one account. Orphaned records are not assigned when identity is missing or ambiguous, preventing another learner's progress from appearing on the wrong profile.
