

GitHub Update Comparison

Previous local baseline vs. integrated origin/main

Date	17 September 2026
Previous revision	9eb9e05 - Configure Android SDK versions
New revision	e563e00 - icon and new build
Update method	Fetch + fast-forward pull + tracked-change stash restore
Local work	Preserved; returned to its prior unstaged state

Outcome

The local main branch now matches origin/main at e563e00. Ten upstream commits were added without discarding the existing Android, backend, admin-user-management, reports, screenshots, or QA artifacts.

Notable upstream changes

Admin panel: New operations pages, refreshed navigation and shell, dashboard/course/upload/certification updates, admin branding assets, and a major admin stylesheet refresh.

Authentication: OTP password recovery and supporting frontend/backend tests were added.

Media: Video-player behavior and HLS/player styling were updated.

Mobile: Launcher icons, app code, Android build configuration, footer behavior, and iOS lockfile updates were pulled.

Frontend: Theme preload, route redirects, navigation/footer refinements, and multiple public page updates were integrated.

Conflict resolution and preservation

File	Resolution
appcopyai/android/build.gradle	Adopted upstream build tools 36.1.0 while preserving the local target SDK 36 setting.
AdminUsersPage.jsx	Combined the upstream CRM drawer, six-column learner layout, progress view, and delete flow with local ban/unban, subscription management, audit history, and account-state controls.
admin-react.css	Merged automatically; local styling changes remain over the new upstream admin design.

Verification performed

Check	Result	Evidence
Frontend production build	PASS	Vite transformed 114 modules and completed the production build.
Admin maintenance tests	PASS	9/9 tests passed.
Admin user controls	PASS	3/3 focused tests passed for ban/session revocation, subscription validation, and audit metadata.
Repository synchronization	PASS	main and origin/main both resolve to e563e00.
Conflict markers	PASS	Both conflicts were resolved and marked; no unmerged paths remain.

Safety note

The automatic stash created before pulling remains available as `stash@{0}`. It is a temporary recovery copy; the restored working tree already contains the preserved local changes. Untracked files were never moved or deleted.
