

Skillomate update

Annual checkout, tutor session continuity, OTP configuration and course-description cleanup

Implementation complete locally. Production sign-off remains pending. Automated suites and the web build pass. No production deployment, live transaction or SMS was performed.

Baseline and scope

Pulled origin/main by fast-forward from **9ff0e11** to **361a6aa** with a clean working tree. Team changes were preserved. The comparison below uses the freshly pulled revision as the implementation baseline. Changes remain uncommitted.

Area	Before (361a6aa)	After (local working tree)
Annual checkout	Yearly pricing card opened monthly trial checkout; backend accepted trial/monthly only.	Annual selection retained through sign-in; separate yearly provider plan, amount and entitlement handling. No trial add-on.
Billing management	No cancellation control in the web profile; old trial expiry could mask paid expiry.	Confirmation before stopping renewal; already-paid access retained. Annual expiry is shown correctly.
Native AI Tutor	Expired bearer token produced a login-again error; no refresh/retry in the client.	One shared refresh for concurrent requests; rotated tokens persisted; one retry; stale-session and logout guards.
Skillomate OTP	New values already present locally; example/checker did not document all new metadata.	Secrets preserved; template/sender/DLT documented and checked. Mocked send, resend and verify coverage added.
Course descriptions	Web course-detail cleanup existed, but other learner views could show Markdown markers.	Display-only cleanup extended to native and web library/lesson descriptions; paragraphs and bullets retained.

Verified annual configuration

Live plan: plan_TdSoXLQTCRb7P. A read-only Razorpay lookup returned yearly interval 1, INR 499900 paise. Local API pricing confirms annualAvailable=true. Test-mode annual plan is not configured; it cannot fall back to the Live plan.

Annual cycle count defaults to 10, matching the existing monthly plan's 10-year schedule. Access follows paid provider invoice dates, rather than an assumed 365-day duration. The original monthly offer remains available.

Verification and handoff

Evidence, limitations and release requirements

Check	Result	Evidence / boundary
Backend and cross-app	163 tests passed	Full node:test suite; annual selection, entitlement, token rotation/races, OTP and existing regressions.
Web components	81 tests passed / 16 files	Vitest/jsdom; annual continuation, unavailable plan, monthly regression, cancellation confirmation and descriptions.
Web production build	Passed	Full generation, Vite bundling and static copying. Existing HLS chunk warning: 592.43 kB minified.
Native source	Syntax passed	App and service modules parsed with Babel. No Android/iOS binary build or device run.
Local HTTP/API	Passed	Database healthy; annual checkout HTTP 200; Live annual price returned. Final checkout CSP permits Razorpay script/frames.
Rendered mobile UI	Unverified	In-app Browser failed before tab acquisition. User explicitly declined standalone-browser fallback.
Live OTP/payment flow	Not performed	No SMS, charge, mandate creation or cancellation. Template approval/mapping and SMS delivery not proven.

Operational details

The local API was restarted with background jobs disabled. Environment edits contain the verified Live annual plan ID, annual price and cycle count; existing secret values were preserved. No database migration or bulk subscription update was made.

Native refresh keeps the 15-minute access-token lifetime. Temporary failures retain login; confirmed revocation requires sign-in. Storage writes are serialized, and profile updates retain the latest tokens. The in-player course assistant retains its existing compatible-session path.

OTP template: **6aad0fdca0b55cc6b0003083**; sender: **SKLMTE**; DLT template: **1777178964721923789**. The v5 send API uses the OTP template ID; sender/DLT mapping remains provider-managed. Credentials are intentionally excluded from this report.

Before production rollout

Deploy the main web app and primary API together with the documented environment variables. Build and release the native app separately. Configure a separate Test annual plan and exercise provider sandbox purchase, renewal and cancellation. Verify OTP delivery with an authorized test number. Complete mobile layout/keyboard checks and native expiry/resume/restart testing.
