

Marketing checkout flow comparison

Skillomate | 4 October 2026 | Local build and QA

Marketing now follows the existing offer onboarding sequence, using PhonePe for its one-time payment.

Area	Previous	Updated
Initial popup	Name, phone, password, age, gender	Phone number only
Verification	OTP then save profile	OTP then verified onboarding session
Payment	PhonePe one-time payment	PhonePe retained; check existing access before checkout
After confirmation	Complete account inside marketing and redirect home	Request paid handoff and redirect to /signup#onboarding=code
Details	Collected before payment	Existing signup details step after payment; phone verification reused
Recovery	Overlapping status checks possible	One status request at a time; reuse verified session for checkout retry; preserve pending-payment recovery

Implementation and validation

- Changed MarketingCheckoutFlow.tsx only. Removed profile and account-completion requests and marketing auth-token writes.
- Production Next.js build, TypeScript validation and static export passed. Existing workspace-root warning remains.
- Playwright mobile browser QA passed: phone-only popup, OTP, one-time PhonePe redirect, pending payment blocked from handoff, confirmed payment redirected to signup, no unexpected profile/complete requests or page runtime errors.
- Browser plugin unavailable; used installed Playwright. OTP, payment and signup destination were mocked. Live gateway processing and full signup submission were not tested.
- No backend, gateway configuration, admin behavior or deployed site changed.

Admin mandate finding

AdminUsersPage uses "Mandate not started" whenever mandateStatus is missing or unrecognized. One-time PhonePe access intentionally stores no mandate and has no next billing date. That label does not establish payment failure. Real Razorpay learners showing the same fallback require checking the returned billingSummary against provider records; live learner data was not accessed.
