

Instagram-Style Interactive Root-Tab Swipe

The attached 17.61-second Instagram recording was reviewed frame-by-frame. The new build reproduces its defining interaction: real pages follow the finger on a continuous horizontal track while the bottom navigation stays fixed.

PREVIOUS BUILD	NEW BUILD
Current page stayed stationary during the drag.	Current and destination pages move together at finger speed.
Destination appeared only after release.	The real adjacent destination is visible continuously during the drag.
Release caused a direct content switch.	Release settles the track with a clamped spring; cancellation returns smoothly.
No moving-page chrome.	Moving pages use rounded edges and a 10-point black separator, matching the reference.

Implementation architecture

Permanent page slots	Each root tab owns one stable position on a single horizontal track. Pages are never swapped between current and preview roles.
One track transform	Finger movement updates the track translation, so both visible page edges move in perfect lockstep without a commit-time rebase.
Neighbor preload	The active page and its immediate neighbors are mounted before the swipe. Previously visited pages remain keyed and retained.
Reference settlement	A damped, overshoot-clamped native transform spring finishes or cancels the swipe; rounded page chrome eases back to square at rest.
Fixed navigation	The bottom bar is outside the moving track. Its gold selected state changes only after the destination finishes settling.
Gesture isolation	Horizontal intent thresholds remain in place, and nested lesson carousels can reserve their own horizontal gestures.
Build/configuration	No new package or native dependency. App identifier, version, build number, and native project configuration are unchanged.

Motion Fidelity and Verification

Reference video: 1284 x 2778 at approximately 55 fps. Implementation validation: iPhone 17 simulator running iOS 26.5. Browser tooling was not applicable because this is a native React Native surface.

CHECK	RESULT	EVIDENCE
Finger-tracked two-page motion	PASS	Slow two-second swipe shows both real pages moving continuously.
Rounded edges and black separator	PASS	Visible during drag and removed when the destination settles.
Bottom bar remains stationary	PASS	Bar position does not move with the page track.
Selection changes after settlement	PASS	Home stays gold mid-drag; Explore becomes gold only after commit.
Forward and reverse navigation	PASS	Home to Explore and Explore to Home both reached expected content.
Short swipe cancellation	PASS	Track returned to Home without changing tabs.
Carousel gesture isolation	PASS	Lesson carousel remained on Home and did not trigger root navigation.
Profile, Nex AI, Downloads route	PASS	Reverse swipes rendered expected content on each tab.
iOS production export	PASS	731 modules bundled; Hermes output 2.3 MB.
Source validation	PASS	git diff --check completed without errors.
