

Live Swipe Preview Build Comparison

This iteration upgrades the first swipe-navigation build into a finger-tracking pager. The current page moves with the gesture while a lightweight representation of the adjacent destination enters beside it before release.

BUILD

Passed

Native iOS: 0 errors; 2 known project warnings

GESTURE QA

Passed

Forward, reverse, cancel, carousel, and multi-tab routes

DEPENDENCIES

None

React Native Animated and PanResponder only

BEFORE / AFTER

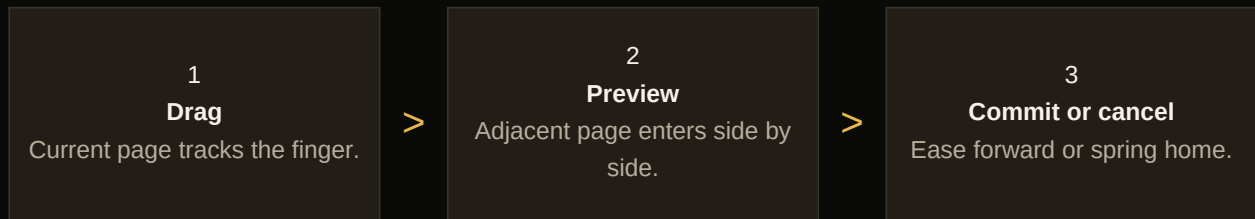

Area	Previous swipe build	Live-preview build
During drag	Current page moved up to 28 points as feedback.	Current page follows the finger across the full viewport.
Adjacent page	Destination appeared only after release.	A memoized, non-interactive destination preview enters beside the current page.
Commit	Short outgoing nudge, destination swap, then spring.	Remaining distance completes with a 190 ms cubic ease, then swaps to the real destination.
Cancel	Small nudge returned to center.	Incomplete drags spring back with tuned damping, stiffness, and mass.
Access guard	Downloads validated when navigation executed.	Downloads validates before the outgoing page can leave; blocked swipes return safely and show membership help.
Accessibility	VoiceOver announcement and Reduce Motion support.	Retained. Preview content is hidden from accessibility until the destination commits.

What remains unchanged

- Tab order remains Home, Explore, Downloads, Nex AI, and Profile.
- Directional edge activation still protects horizontal lesson carousels.
- Course details, reels/player, profile sub-pages, subscription, help, and legal screens remain outside root paging.
- Bottom-tab taps, membership rules, APIs, app version/build number, and native dependencies are unchanged.

MOTION AND VERIFICATION

Pager behavior at a glance

Implementation details

- Animated.Value and refs hold high-frequency gesture state without triggering React renders on every move.
- The adjacent page is aligned one viewport away and interpolates into position with the active drag.
- The preview is memoized, uses only lightweight visual content, and triggers no duplicate data requests.
- Reduce Motion switches destinations without the animated travel, while VoiceOver receives a single destination announcement.

Verification matrix

Check	Result	Evidence
JavaScript export	PASS	Expo iOS production bundle exported successfully: 731 modules and Hermes bundle.
Native iOS build	PASS	Xcode simulator build completed with 0 errors. Two existing project warnings remain: RCTAppDelegate deprecation and duplicate -lc++ linkage.
Live preview	PASS	Simulator video and frame sheet confirmed side-by-side page movement during a normal-speed swipe.
Bidirectional	PASS	Home -> Explore and Explore -> Home both completed and exposed the expected screen content.
Cancel behavior	PASS	A short swipe returned to Home and cleared the transient preview.
Carousel isolation	PASS	The Home lesson rail scrolled horizontally without changing the selected root tab.
Cross-tab route	PASS	Profile -> Nex AI -> Downloads completed using reverse-direction paging.
Source cleanliness	PASS	git diff --check completed successfully.

Primary code surface

appcopyai/App.js - destination preview model, memoized preview screen, finger-tracking pager, access preflight, cancel spring, motion interpolation, and preview styling.
