

Stationary Bottom Navigation and Flash-Free Swipe Handoff

BOTTOM BAR FIXED - ACTIVE TAB CHANGES BY COLOR

Finding from the supplied recording

Frame-by-frame inspection of the 20.09-second, 418 x 888 recording showed two bottom navigation bars during a drag: one attached to the outgoing page and another attached to the destination preview. Both bars moved horizontally. At commit, the outgoing page translation was reset before the destination render completed, producing a visible old-screen flash.

Before and after

Area	Previous build	Corrected build
Bottom bar	Nested inside every animated screen and duplicated in the preview.	Rendered once above the page animation and remains stationary.
Selected tab	The whole bar moved; filled and outline icons could swap.	Icon geometry stays fixed; only the active icon and label color changes.
Commit handoff	Outgoing page reset to x=0 immediately after requesting navigation.	Destination stays visible while activeTab updates; reset occurs in the layout phase.
Previous-screen flash	Possible for one or more frames during the asynchronous parent update.	Outgoing content is never returned to the viewport during commit.
Cancelled drag	Page and attached bar sprang back together.	Only the page springs back; the fixed bar restores its original active color.

Implementation changes

- Moved the root BottomNav outside the Animated.View that translates page content.
- Suppressed screen-owned navigation bars through the existing root swipe context.
- Removed the navigation bar from SwipeTabPreview so no second bar can enter from an edge.
- Used previewTab or activeTab only to choose the stationary bar's gold color state.
- Added pendingTabRef and a layout-phase handoff so the old screen cannot flash at x=0.
- Kept callbacks and transient transition state in memoized objects and refs.

Verification matrix

Check	Observed evidence	Result
Recording analysis	Supplied video reproduced moving duplicate bars and the handoff flash.	CONFIRMED
Forward swipe	Home to Explore completed from the center of the screen.	PASS
Reverse swipe	Explore to Home completed with no previous-page reset frame.	PASS

Check	Observed evidence	Result
Fixed bottom bar	All recorded transition frames retained one bar at the same screen coordinates.	PASS
Color-only state	Outline icons stayed geometrically stable; selected icon and label turned gold.	PASS
Short drag cancel	Home remained visible and active color returned to Home.	PASS
Horizontal carousel	Course rail swipe remained on Home and did not move the root page.	PASS
Multi-tab route	Profile to Nex AI to Downloads passed through reverse swipes.	PASS
iOS export	Expo exported 731 modules and a 2.3 MB Hermes bundle.	PASS
Diff hygiene	git diff --check reported no whitespace errors.	PASS

Release assessment

The reported moving-bottom-bar and previous-screen flash defects are resolved on the iPhone 17 simulator. No package, native dependency, app version, or iOS build-number change was required.

Known unchanged warning

React Native DevTools still reports the existing SafeAreaView deprecation warning. It is unrelated to this transition fix.
