

Swipe Anywhere Regression Fix

CENTER-SCREEN SWIPE RESTORED

Outcome

The previous build only accepted root-tab swipes that began close to a screen edge. The corrected build accepts a clear horizontal gesture across normal page content, keeps the adjacent-tab preview, and protects embedded horizontal course carousels.

Before and after

Area	Previous build	Corrected build
Swipe start	Required the first touch within about 56-72 points of an edge.	Works from the center or edge on normal root-tab content.
User feedback	A normal swipe appeared to do nothing.	The page tracks the finger and completes the tab change.
Page preview	Adjacent lightweight preview was available only after the edge gate passed.	Adjacent preview appears during any accepted root-tab swipe.
Carousels	Protected indirectly by the edge-only rule.	Explicit touch boundary keeps lesson and project rails independently scrollable.
Vertical scroll	Direction-filtered.	Still direction-filtered; horizontal distance must dominate vertical travel.

Implementation notes

- Removed the directional-edge requirement from the root PanResponder eligibility check.
- Retained the horizontal-versus-vertical intent threshold and commit/cancel thresholds.
- Added a stable context-backed boundary for nested horizontal FlatList and ScrollView rails.
- Kept transient gesture flags in refs to avoid per-frame React renders.
- No dependency, native configuration, version, or build-number changes.

Validation

Check	Evidence	Result
Failure reproduction	70% to 20% center-area swipe did not reveal Explore before the fix.	CONFIRMED
Forward center swipe	Home to Explore; Search courses here became visible.	PASS
Reverse center swipe	Explore to Home; Continue Learning became visible.	PASS
Short drag cancel	10% drag returned to Home without changing the active tab.	PASS

Check	Evidence	Result
Carousel isolation	Horizontal course-rail swipe remained on Home.	PASS
Rendered state	iPhone 17 simulator showed Explore selected after the corrected gesture.	PASS
iOS export	Expo exported 731 modules and a 2.3 MB Hermes bundle.	PASS
Diff hygiene	git diff --check completed without whitespace errors.	PASS

Known, unchanged item

React Native DevTools still reports the existing SafeAreaView deprecation warning. It is unrelated to the swipe failure and did not block this interaction fix.

Release assessment

The reported swipe failure is resolved on the iPhone 17 simulator. The app was left on Home with Metro and the backend running for continued review.
