

Swipe Navigation Build Comparison

This release adds Instagram-inspired horizontal navigation across Skillomate's five existing root destinations, while preserving the bottom navigation, course carousels, access rules, and nested learning screens.

BUILD STATUS

Passed

Native iOS build: 0 errors, 0 warnings

ROOT TABS

5

Home, Explore, Downloads, Nex AI, Profile

NATIVE DEPS

None

Implemented with React Native platform APIs

ROOT NAVIGATION ORDER

Interaction model

- Swipe left from the right edge to move to the next root tab.
- Swipe right from the left edge to move to the previous root tab.
- Bottom navigation taps remain available and use the same centralized route logic.
- Root swiping is deliberately disabled inside course details, the lesson list, the reels player, subscription pages, legal pages, and other nested routes.

Why edge-aware gestures?

The Home experience contains horizontal lesson rails. Directional edge activation prevents root navigation from stealing those in-content swipes, while still making adjacent destinations quick to reach.

What changed in this build

Area	Previous App Store optimized build	New swipe-navigation build
Root navigation	Bottom-tab taps only.	Bottom-tab taps plus adjacent horizontal edge swipes.
State handling	Each screen changed root state through separate callbacks.	A single root navigation callback clears stale player state and applies access rules consistently.
Gesture safety	No root gesture layer.	Horizontal intent threshold, directional edge zone, distance/flick threshold, and bounded visual feedback.
Accessibility	Accessible bottom-tab labels and selected state.	Existing labels retained; VoiceOver announces the destination and Reduce Motion removes the transition animation.
Protected access	Downloads checked membership access on tab taps.	The same guard now applies to both tap and swipe navigation; blocked navigation opens the existing membership modal.
Nested experiences	Course and legal sub-screens opened independently.	Unchanged. Root swipes do not run inside course details, reels/player, profile sub-pages, or legal/help screens.
Dependencies	Existing Expo / React Native stack.	No new package or native dependency; uses Animated, PanResponder, AccessibilityInfo, hooks, and refs.

Implementation notes

- Gesture values live in Animated.Value and refs, avoiding render churn during high-frequency movement.
- Animations run with the native driver and remain intentionally subtle: a maximum 28-point translation with a short spring return.
- Responsive thresholds scale with window width, with practical minimums and maximums for iPhone sizes.
- The release does not change API endpoints, data models, entitlement logic, iOS privacy declarations, or the current app version/build number.

Primary code surface

appcopyai/App.js - root tab order, swipe responder, accessibility behavior, centralized navigation guard, and wrappers for the five root screens.

VERIFICATION

Simulator evidence and release checks

Check	Result	Evidence
iOS JavaScript export	PASS	Expo iOS bundle exported successfully: 731 modules, Hermes bundle produced.
Native iOS compile	PASS	Xcode simulator build succeeded with 0 errors and 0 warnings.
Forward root swipe	PASS	Automated Home -> Explore gesture; selected tab and Explore screen confirmed visually.
Reverse root swipe	PASS	Automated Explore -> Home and Profile -> Nex AI gestures confirmed visually.
Five-tab route	PASS	Home, Explore, Downloads, Nex AI, and Profile exercised through tap/swipe combinations.
Carousel regression	PASS	Home lesson rail scrolled horizontally without switching the active root tab.
Source cleanliness	PASS	git diff --check passed; no diagnostic gesture logging remains.
